

## Longitudinal collection of COVID-19 related data

This unique dataset enables researchers to study in detail the relationship between COVID-19 risk factors and physical and mental consequences of a pandemic.

**Prof. dr. Jochen Mierau**  
professor Public Health Economics,  
University Groningen

At the very beginning of the COVID-19 pandemic in the Netherlands, a large-scale study into the risk factors of the novel coronavirus started in the Northern Netherlands. Since then, 135,000 Lifelines participants receive (bi-) weekly, extensive questionnaires about their health, wellbeing and lifestyle. The collected COVID-19 questionnaire data is linked to the previously collected longitudinal data from the Lifelines biobank. Lifelines encourages researchers worldwide to use these data to gain insight into the risk factors, spreading and (longterm) consequences of the coronavirus.

[Click here for the COVID-19 cohort paper](#)

135,000 participants

12 questionnaires between  
march and september 2020

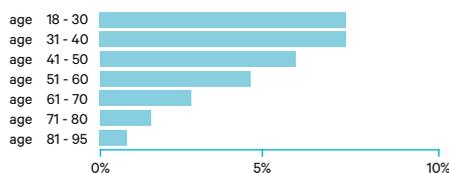

36% average  
response rate

14% completed  
all questionnaires (19,239)

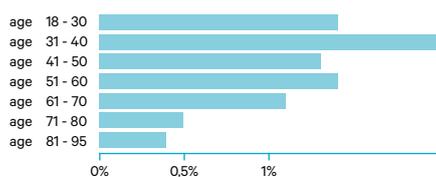

31% completed 4 or more  
questionnaires (42,812)

## Prevalence COVID-19

### Self-diagnosed: 6,2% (n=4,300)

### Positive test or diagnosed by physician: 1.4% (n=1,036)

### Positive test result and diagnosed by physician by gender

32%  
male

68%  
female

This factsheet is based on data from the first 9 questionnaires.

More results can be found at [coronabaroeter.nl](https://coronabaroeter.nl)

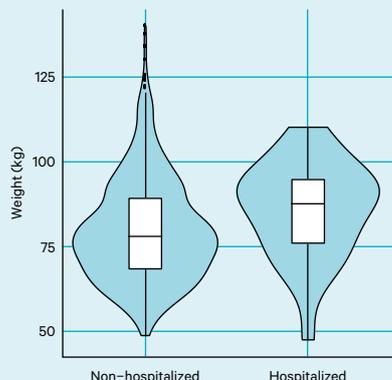

## COVID-19 questionnaire content

### Risk factors

- General health
- Chronic disease status
- Medication use
- Medical history
- Lifestyle

### BMI

Weight of participants with positive test or diagnosed by physician

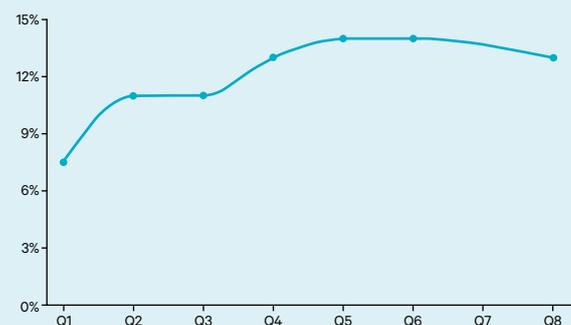

### Impact

- Social demographics
- Mental health and well-being
- Quality of life
- Employment situation
- Income

### Job loss

Percentage of unemployed participants that indicate to have lost their job as a result of the COVID-19.

Average unemployment rate of 4.8%

### This study is a joint initiative

Lifelines is a large population-based cohort and biobank which started in 2006 with 167,000 inhabitants of the northern part of the Netherlands. Our aim is to enable research to better prevent, predict, diagnose and treat diseases. For this purpose participants are being followed for 30 years and surveyed every 5 years. We collect data through questionnaires and measurements on a wide range of topics such as lifestyle, environment, multi-omics, and medical history. In addition, Lifelines offers research opportunities through:

- A versatile collection of over 8 million samples
- Record linkage with other registries
- Re-invitation of specified subsets of participants

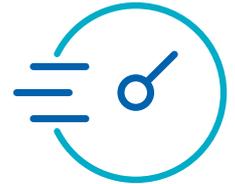

167,000 participants

Worldwide available

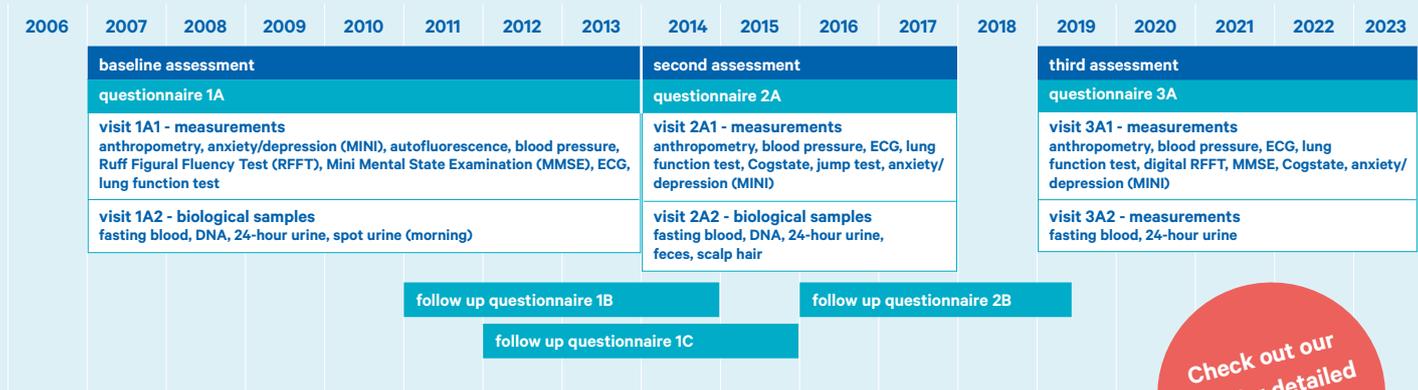

Three generations

Fast data access

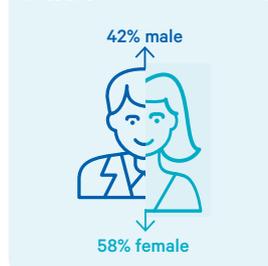

### Timeline

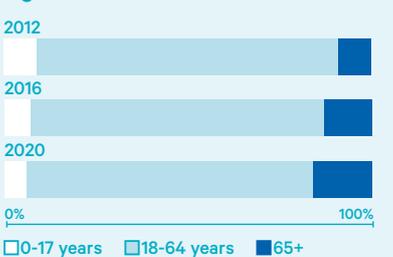

### Participants

### Gender

### Age

### Family relations\*

28,000 siblings  
45,000 participants with children  
85,000 participants part of 2-generations  
20,500 participants part of 3-generations

\* Note: these numbers represent the total number of participants, not the number of families

### available data & biological samples

#### Measurements

- anthropometry
- blood pressure
- ECG
- lung function
- cognitive tests
- psychiatric interview
- skin autofluorescence

#### Questionnaires

- medical history
- lifestyle
- nutrition
- physical activity
- social-demographic factors
- quality of life
- symptoms
- personality
- stress
- social context
- other

#### Biological samples

- blood (fasting sample)
- 24h urine
- faeces
- scalp hair
- DNA
